ribosyltransferase activity, while the B subunits (EEXB and CtxB)
facilitate the entry of subunit A into the host cell via the binding and
cross-linking of GM-1 receptors. Although GM-1 binding is responsible
for some of the effects of Etx and Ctx, it has been found that certain
effects of the toxins, such as immunomodulation, are not mediated
through GM-1 binding. The peptides of the invention are fragments of the
beta-4- alpha-2 loop of EtxB and/or CtxB, exerting the same effects as
normal EtxB and CtxB subunits, except that they do not bind or cross link
GM-1. They may be used in medicine as an immunomodulator or adjuvant.
Therefore, the peptides may be used in the production of a composition
for treating, preventing and/or modulating a disease associated with an
immune disorder and/or toxin-induced diarrhoea. Sequences AAY87460-Y87463

The DNA sequence encoding this ligates to othersynthetic oligonucleotides to form a new recombinant gene. This encodes a flagellin fusion protein which can be used in vaccines for immur therapy.
                                                              Sequence
                                                                                               A compsn. comprising a conjugate of an antigenic cholera B toxin peptide fragment (e.g. AAR85126-30 and esp. AAR85125), covalently bound to a microparticulate inert carrier (e.g. modified silica of thyroglobulin) can be used as an orral vaccine for immunisation against cholera infection. The inert carrier is insoluble in the digestive tract, allowing presentation of the antigen in the intestines, where it will elicit antibodies mainly of the

                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to peptide fragments of the Escherichia coli heat CC labile enterotoxin (Etx) and its closely related homologue, cholera CC toxin (Ctx) from Vibrio cholerae which do not bind to the ubiquitous CC GM-1 ganglioside receptors on host cell surfaces. Both Etx and Ctx are CC composed of one A subunit and five identical B subunits. The A subunit is responsible for toxicity, while the B subunits (EtxB and CtxB) CC ribosyltransferase activity, while the B subunits (EtxB and CtxB) CC facilitate the entry of subunit A into the host cell via the binding and CC cross-linking of GM-1 receptors. Although GM-1 binding is responsible CC through GM-1 binding, such as immunomodulation, are not mediated CC through GM-1 binding. The peptides of the invention are fragments of the beta-4 alpha-2 loop of Etx and Ctx, it has been found that certain CC through GM-1 binding. The peptides of the invention are fragments of the CC mormal EtxB and CtxB subunits, except that they do not bind or cross link GM-1. They may be used in medicine as an immunomodulator or adjuvant. CC They may also be used as an inhibitor for toxin-induced diarrhoea.

CC for treating, preventing and/or modulating a disease associated with an immunomodulator or adjuvant.
                                                                                                                           Query Match

                                                                                             effects of the toxins, such as immunomodulation, are not mediated through GM-1 binding. The peptides of the invention are fragments of the beta-4- alpha-2 loop of EtxB and/or CtxB, exerting the same effects as normal EtxB and CtxB subunits, except that they do not bind or cross link GM-1. They may be used in medicine as an immunomodulator or adjuvant. They may also be used as an inhibitor for toxin-induced diarrhoea. Therefore, the peptides may be used in the production of a composition for treating, preventing and/or modulating a disease associated with an immune disorder and/or toxin-induced diarrhoea. Sequences AAY87460-Y87463 represent preferred peptides of the invention, AAY87460 being
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to peptide fragments of the Escherichia coli heat labile enterotoxin (Etx) and its closely related homologue, cholera toxin (Ctx) from Vibrio cholerae which do not bind to the ubiquitous GM-1 ganglioside receptors on host cell surfaces. Both Etx and Ctx are composed of one A subunit and five identical B subunits. The A subunit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              immunomodulators and for treating diarrhea and which do not bind the glycolipid receptor GM-1 -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAY87463 standard; peptide;
                                                                                                                                                                                                                                                                                                                                                                                                                                               is responsible for toxicity, possessing adenosine diphosphate (ADP) ADP-ribosyltransferase activity, while the B subunits (EtxB and CtxB) facilitate the entry of subunit A into the host cell via the binding and cross-linking of GM-1 receptors. Although GM-1 binding is responsible for some of the effects of Etx and Ctx, it has been found that certain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             07-SEP-1998;

                                                               Query Match
                                                                                                                                                                            This sequence is encoded by a fragment of the the plasmid pLPA93 which was used in the production of fimH fusion genes comprising the cholera toxin B subunit inserted into the fimH gene. This insert shows the inclusion of the B subunit into the FimH gene and ifferent position of the hepatitis B virus surface antigen pre-S2 region into a different position of the FimH adhesin of type I fimbriae. Restiction site handles (BgIII-sites) were introduced into the fimH gene, and the foreign epitopes are then inserted in-frame. In the selected positions the insertion of the epitopes did not significantly alter the adhesive function of the FimH protein. The expression of the chameric proteins on the surface of fimbriae on bacterial hosts illustrated the possibility of using bacterial adhesins as general presenters of foreign antigens and epitopes.
                                                                                                                                       epitopes. These chimeric genes may be used in the production of variant FimH adhesins which may be useful for targetting active compounds and microbial cells to locations comprising selected receptors to which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             FimH;

Tests have shown that Arg in posns. 35, 67 and 73 play an important role in fixing these toxins to cell walls. The peptides are used in the treatment of, and vaccination against, cholera infections and animal and human infections due to E. coll (enterotoxin LT). The medicament may be administered by oral, intraperitoneal, sub-cutaneous or intravenous routes. For vaccines, pref. peptides having 15-30 AAs are injected without carriers. Unit dose when used as a medicament is 50-500mg as a vaccine 1-10mg of active cpd.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cholera toxin B, sub-unit polypeptide(s) as vaccines and medicaments - effective against Escherichia coli and Vibrio cholerae infections, are prepd. by solid phase peptide synthesis

                  administered by oral, intraperitoneal, sub-cutaneous or intravenous routes. For vaccines, pref. peptides having 15-30 AAs are injected without carriers. Unit dose when used as a medicament is 50-500mg as
                                                The inventors claim cholera toxin B1 subunit sequences which carry Arg in posn. 35, 67 or 73 (AAP30264, AAP30265, AAP30600). Tests have shown that Arg in posns. 35, 67 and 73 play an important role in fixing these toxins to cell walls. The peptides are used in the treatment of, and vaccination against, cholera infections and animal and human infections due to E. coli (enterotoxin LT). The medicament may be

                                                                                                                                                                                                                                                                                                        Armstrong
Oomen R,
                                                                                                                                             AAR72540-R72545 are structurally equivalent B-subunits from three ADP-ribosylating toxins, pertussis holotoxtin (PT), E. coli heat labile toxin (LT), and verotoxin-1 (VT). The structural information obtd. from these comparisons was used to identify sites which contribute to PT's biological activity. By modifying these sites the claimed PT mutants of the invention were produced, they can be used in the development of vaccines against Bordetella

                                                                                                                             operon; and (3) expressing mutant tox box in a Bordetella organism to produce the modified holotoxin. This method is used for modifying pertussis holotoxin, by studying its 3-dimensional crystalline structure. Modifying the holotoxin, alters its biological properties. By analysing the 3-dimensional crystalline structure of the pertussis holotoxin, functional (aa) which affect biological properties of the pertussis holotoxin can be identified. This can be used to predict (aa) which contribute to the toxicity of the holotoxin to produce immunoprotective, genetically-detoxified analogues of pertussis holotoxin. The present sequence represents an ADP-ribosylating toxin ansumption peptide used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         22-AUG-1994;

                                                                                                                                          В
                                                                                                                                                                                                                                                                                            The invention relates to methods of preparing a pertussis holotoxin (PT) CC having a modified biological activity. One method comprises identifying C at least 1 site in a PT that interacts with a molecule that is capable of forming a complex with the holotoxin and which molecule is an effector consicty, cell binding or enzymatic activity of PT. The functional contributes to the contributes to the contributes of crystalline PT, determined by analysing the three dimensional contentified interacting site(s) are identified by analysing the three dimensional contentified interacting site(s) are modified to alter toxicity, cell binding or enzyme activity of the PT. The methods can be used to alter a biological activity such as toxicity, enzymatic activity, mitogenicity, cell binding and adjuvanticity of the PT. The three-dimensional structure confer have functional and/or structural resemblance to other bacterial confer have functional and/or structural resemblance to other bacterial confer such as diphtheria toxin (DT), Pseudomonas exotoxin A (ETA), the cat-labile toxin of E. coli (LT) and verotoxin-1 (VT). The present

                                                                                                                                                                                                                                                                                                                             The present invention describes a crystalline form of isolated pertussis holotoxin, in which the molecules of pertussis toxin have a three dimensional structure represented in the specification, complexed with a polysaccharide molecule capable of forming a complex with the holotoxin. The crystalline form of the pertussis holotoxin can be used in a comparison with other proteins which have functional resemblance to pertussis holotoxin with the aim of modifying other proteins. Identifying the unknown sites of toxicity by comparison with the three dimensional structure of pertussis holotoxin provides a technique for detoxification of toxins to produce useful immunogenic but non-toxic analogues. It can also be used as a primary standard to measure the quantity, purity or efficacy of less pure compositions containing pertussis toxin. AAY68340 to AAY68385 represent peptides to used in the exemplification of the present invention.
                                                                                                                                                                                                                                              Query Match

31-MAY-1994;
                                                                                                                                                                                                                             The present invention provides a method for producing a pertussis toxin (also designated lymphocytosis-promotting factor, histamine-sensitising factor and islet activating protein) with a modified biological activity, involving analysing the crystal structure of the protein to identify active sites which can then be modified. This may lead to an alteration in the toxicity, cell binding or enzyme activity of the toxin. This can be used in the production of immunoprotective analogues of pertussis toxin is the cause of whooping cough following infection by Bordetella pertussis.
                                                                                                                                                                                                                                                                                                                                                                                                       Modifying pertussis holotoxin to produce detoxified PT analogs, comprising analyzing crystalline structure of toxin, to identify sites of toxicity, cell binding or enzyme activity of PT and modifying identified site
                                                                                                                                                                                                      Sequence

GENERAL INFORMATION:

APPLICANT: Williams, Neil Andrew
APPLICANT: Hirst, Timothy Raymond

TITLE OF INVENTION: Peptide Fragments of Cholera Toxin B or Enterotoxin B as Vacci

TITLE OF INVENTION: Peptide Fragments of Cholera Toxin B or Enterotoxin B as Vacci

TITLE OF INVENTION: Adjuvants

FILE REFERENCE: 7438

CURRENT APPLICATION NUMBER: US/09/786,648

CURRENT APPLICATION NUMBER: PCT/GB99/02970

PRIOR APPLICATION NUMBER: PCT/GB99/02970

PRIOR APPLICATION NUMBER: PCT/GB99/02970

PRIOR FILING DATE: 1999-09-07

NUMBER OF SEQ ID NOS: 6

SOFTWARE: MS DOS

SEQ ID NO 3

LENGTH: 12

TYPE: PRT

ORGANISM: E. Coli

FEATURE:

COTHER INFORMATION: human variant E. coli
